STEREO DOUBLE CASSETTE TAPE DECK AMPLIFIER

DC-X55Z(BK)

MODEL DC-X55Z(BK) AND DC-X55Z COMES IN SEVEN VERSIONS DISTINGUISHED AS FOLLOWS:

	Applicable model		Power requirement	Destination	
Type	DC-X55Z(BK)	DC-X55Z	1 GWG1 TOQUITOTTO		
НВ	0	0	AC220V, 240V*(Switchable)	United Kingdom	
HEZ	0	_	AC220V, 240V*(Switchable)	West Germany	
кс	0	_	AC120V only	Canada	
YP	0	_	AC240V only	Australia	
HE	0	0	AC220V, 240V*(Switchable)	European continent	
KU	0	_	AC120V only	U.S.A	
S	0		AC110V, 120V, 220V, 240V (Switchable) General ma		

- This service manual is applicable to the HB type.
- * Change the primary wiring of the power transformer.
- As to the other types, please refer to the additional service manual.
- Ce manual d'instruction se fefère au mode de réglage en français.
- Este manual de servicio trata del método ajuste escrito en español.

1. SAFETY INFORMATION

1. SAFETY PRECAUTIONS

The following check should be performed for the continued protection of the customer and service technician.

LEAKAGE CURRENT CHECK

Measure leakage current to a known earth ground (water pipe, conduit, etc.) by connecting a leakage current tester such as Simpson Model 229-2 or equivalent between the earth ground and all exposed metal parts of the appliance (input/output terminals, screwheads, metal overlays, control shaft, etc.). Plug the AC line cord of the appliance directly into a 120V AC 60Hz outlet and turn the AC power switch on. Any current measured must not exceed 0.5mA.

AC Leakage Test

2. SPECIFICATIONS

AMPLIFIER SECTION

Continous Average Power Output is 40 Watts* per channel, min., at 8 ohms from 40 Hertz to 20,000 Hertz, with no more than 0.3% total harmonic distortion.

*Measured pursuant to the Feder rules on Power Output Claims for	al Trade Commission's Trade Regulation Amplifiers.
Continuous Power Output	
40 to 20,000Hz	40 W + 40 W (T.H.D. 0.3% 8 ohms)
1 kHz (DIN)	50 W + 50 Vv (T.I+.D. 1% 8 ohms)
1 kHz (DIN music power)	70 W + 70 W (T.H.D. 1% 8 ohms)
PMPO	140 W + 140 W
Hum and Noise (IHF, short-circuited	, A network)
PHONO	
Hum and Noise (DIN continous Pov	ver/50 mV)
PHONO	68 dB/60 dB
Total Harmonic Distortion (40 Hz to	20,000 Hz, 8 ohms)
20 Watts per channel power outp	ut No more than 0.2%
Tape Deck Section	
Systems	4 track, 2-channel stereo
Heads "Ha	ard Permalloy" recording/playback head x 1
	"Hard Permalloy" playback head x 1
	"Ferrite" erasing head x 1
Motor	DC servo 2 speed motor x 2
Fast Winding Time	Approximately 100 seconds (C-60 tape)

ANY MEASUREMENTS NOT WITHIN THE LIMITS OUTLINED ABOVE ARE INDICATIVE OF A POTENTIAL SHOCK HAZARD AND MUST BE CORRECTED BEFORE RETURNING THE APPLIANCE TO THE CUSTOMER.

2. PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in the appliance have special safety related characteristics. These are often not evident from visual inspection nor the protection afforded by them necessarily can be obtained by using replacement components rated for voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this Service Manual.

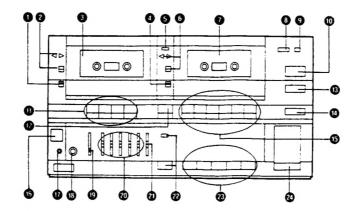

Electrical components having such features are identified by marking with a \triangle on the schematics and on the parts list in this Service Manual

The use of a substitute replacement component which dose not have the same safety characteristics as the PIONEER recommended replacement one, shown in the parts list in this Service Manual, may create shock, fire, or other hazards.

Product Safety is continuously under review and new instructions are issued from time to time. For the latest information, always consult the current PIONEER Service Manual. A subscription to, or additional copies of, PIONEER Service Manual may be obtained at a nominal charge from PIONEER.

Frequency Response	
-20 dB recording:	
Normal tape	35 Hz to 14,000 Hz ±6 dB
CrO;	35 Hz to 15,000 Hz ±6 dB
Metal tape	35 Hz to 16,000 Hz ±6 dB
Signal-to-Noise Ratio	
Dolby NR OFF	56 dB
Noise Reduction Effect	
Dolby B type NR ON	More than 10 dB (at 5 kHz)

Weight (without package)	

3. FRONT PANEL FACILITIES

[CASSETTE TAPE DECK]

- This unit is provided with an automatic tape selector function.
- This unit is a forward mode priority auto-reverse deck. Both recording and playback always start in the forward direction.
 If you press the STOP/EJECT (m/\$\Delta\$) switch during reverse playback, the

head for forward playback will be reselected automatically. • REVERSE MODE switch

Sets the reverse mode for the playback-only deck.

Switch positions:	Play
\Box	Continuous play
\supset	Reverse play

Continuous playback is automatically stopped after 8 round trips. Note that it will be counted as one reversal if the tape direction is changed using the direction switch. (One round trip will be counted if the switch is pressed twice.)

Direction switch/indicator (DIRECTION)

Depress to set the playback direction of the playback-only deck. Direction change can only be performed during playback.

- ▶ ... Lights when forward mode is selected.
- Lights when reverse mode is selected.
- Cassette compartment (Playback only)

REVERSE MODE switch

Sets the reverse mode for the record/play deck.

Switch positions	Play	Record	
\mathbb{C}	Continuous play	Double-side recording	
—	Reverse play	Single-side recording	

Continuous playback is automatically stopped after 8 round trips. Note that it will be counted as one reversal if the tape direction is changed using the direction switch. (One round trip will be counted if the switch is pressed twice.)

Recording indicator (REC)

 Lights during recording. Flashes during tape copying. (DC-X55Z and DC-555Z only)

6 Direction switch/indicator (DIRECTION)

Depress to set the recording and playback direction of the record/play deck. Direction change can be performed during recording, playback or pause.

- Lights when forward mode is selected. Flashes if tape travel is stopped during reverse recording.
- □ Lights when reverse mode is selected.
- Cassette compartment (Recording and playback)
- TAPE COUNTER (Record/play deck.)

3-digit display measures tape travel on record/play deck.

1 TAPE COUNTER RESET button

COPY SPEED switch

Press to set the copy mode.

NORMAL ... Permits you to listen to playback normally during dubbing (normal speed copying)

HIGH ... High speed dubbing (double-speed, half-time copying)

Playback-only switches

(PLAY) Forward or reverse mode playback.

(FAST) Rewind in forward mode, fast forward in reverse mode.

(FAST) Fast forward in forward mode, rewind in reverse mode. ■/≜ (STOP/EJECT) ... Stops tape travel. Ejects cassette if pressed when

tape is stopped.

Synchronized copy switch (SYNCHRO COPY)

Press to start copying from Deck I to Deck II. Set the copying speed (NOR-MAL or HIGH) using the COPY SPEED switch.

Press this switch only after you have set the COPY SPEED switch as desired. If this switch is pressed first, the speed cannot afterwards be changed, even if the COPY SPEED switch position is later changed.

Dolby NR switch

Press to activate noise reduction system. Use to play back tapes recorded using Dolby B NR noise reduction.

- Tapes recorded using Dolby B NR noise reduction should always be played back with the noise reduction system on. Sound quality will be adversely affected if they are played back with the system off, or if tapes recorded using a different noise reduction system are played back with the Dolby B NR system on.
- It is recommeded that tapes recorded using Dolby B NR be so marked on the label. This will help to prevent incorrect setting of the noise reduction switch during playback.

Noise reduction manufactured under license from Dolby Laboratories Licensing Corporation.

"Dolby" and the double-D symbol are trademarks of Dolby Laboratories Licensing Corporation.

Recording mute switch (REC MUTE)

Use to create blank intervals on a tape during recording. Works only while held depressed.

Record/Playback switches

♠ (REC) Record

(PLAY) .. Playback in forward or reverse mode.

(FAST) Rewind in forward mode, fast forward in reverse mode.

(FAST) Fast forward in forward mode, rewind in reverse mode.

(STOP/EJECT) .. Stops tape travel. Ejects cassette if pressed when tape is

stopped.

■■ (PAUSE) Temporarily stops tape travel. Cancels pause mode when

pressed again.

[AMPLIFIER/GRAPHIC EQUALIZER]

D Power switch (POWER)

Headphone jack (PHONES)

For miniature stereo phone plug.

Microphone jack (MIC)

For standard phone plug.

Mic Mixing Controls (MIC MIXING)

Adjusts balance between mic volume and volume of other input sources.

Source input emphasized

To listen to the sound from a microphone mixed with that of a radio piavback:

Mic input emphasized

NOTE:

- Set the control to the SOURCE position as shown in Fig. A when not using a microphone.
- Source volume is cut by about 1/100 when control is set to the MIC position.

@ Graphic equalizer controls (GRAPHIC EQUALIZER)

Fine adjustments in sound quality are possible using the 5 controls on the graphic equalizer.

BALANCE control

SURROUND/STEREO WIDE switch/indicator

By using this function, the sounds from stereo sources will be given new breadth, reproducing the effect of concert hall presence.

Stereo Wide sound has no effect on monaural sources (AM broadcasts,

Function switches (FUNCTION)

Press the button corresponding to the desired program source. TUNER Press to listen to radio.

VIDEO Press to listen to component (Hi-Fi VCR, laser disc player, etc.) connected to the auxiliary input lacks.

CD Press to listen to CD player. PHONO Press to listen to turntable. TAPE Press to listen to tape playback.

Volume Control (VOLUME)

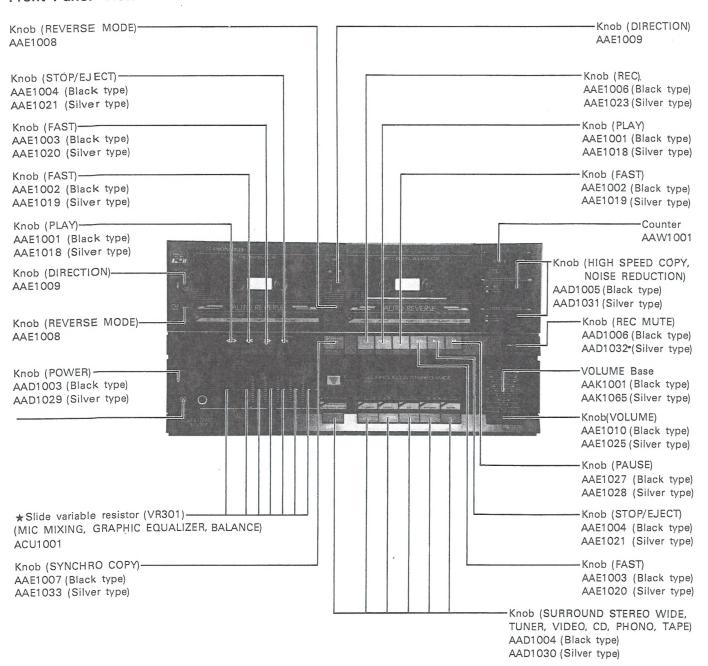

4. PARTS LOCATION

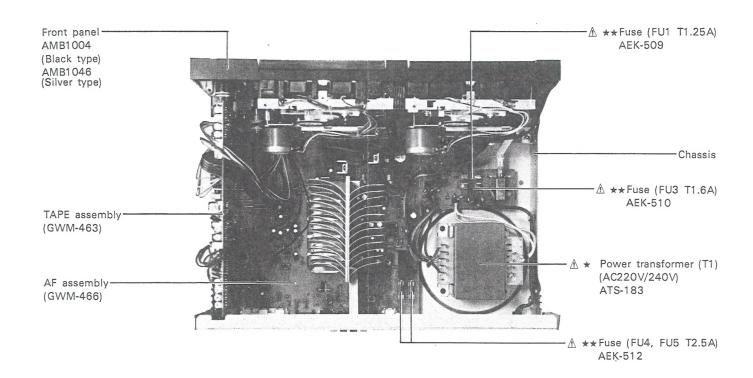

NOTES:

- The
 <u>↑</u> mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.
- For your Parts Stock Control, the fast moving items are indicated with the marks ★ ★ and ★.
 - ★★ GENERALLY MOVES FASTER THAN ★
 - This classification shall be adjusted by each distributor because it depends on model number, temperature, humidity, etc.
- Parts marked by " @ " are not always kept in stock. Their delivery time may be longer than usual or they may be unavailable.

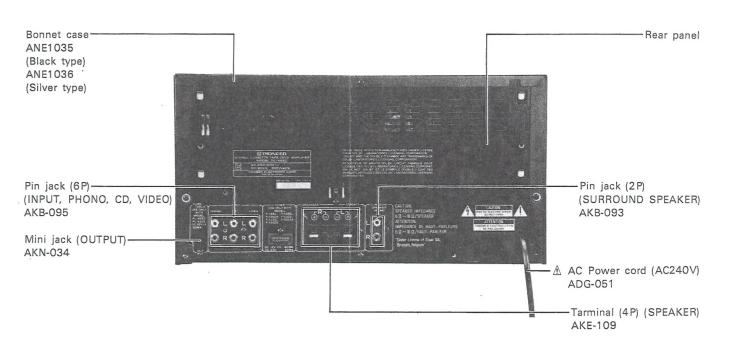

Front Panel View

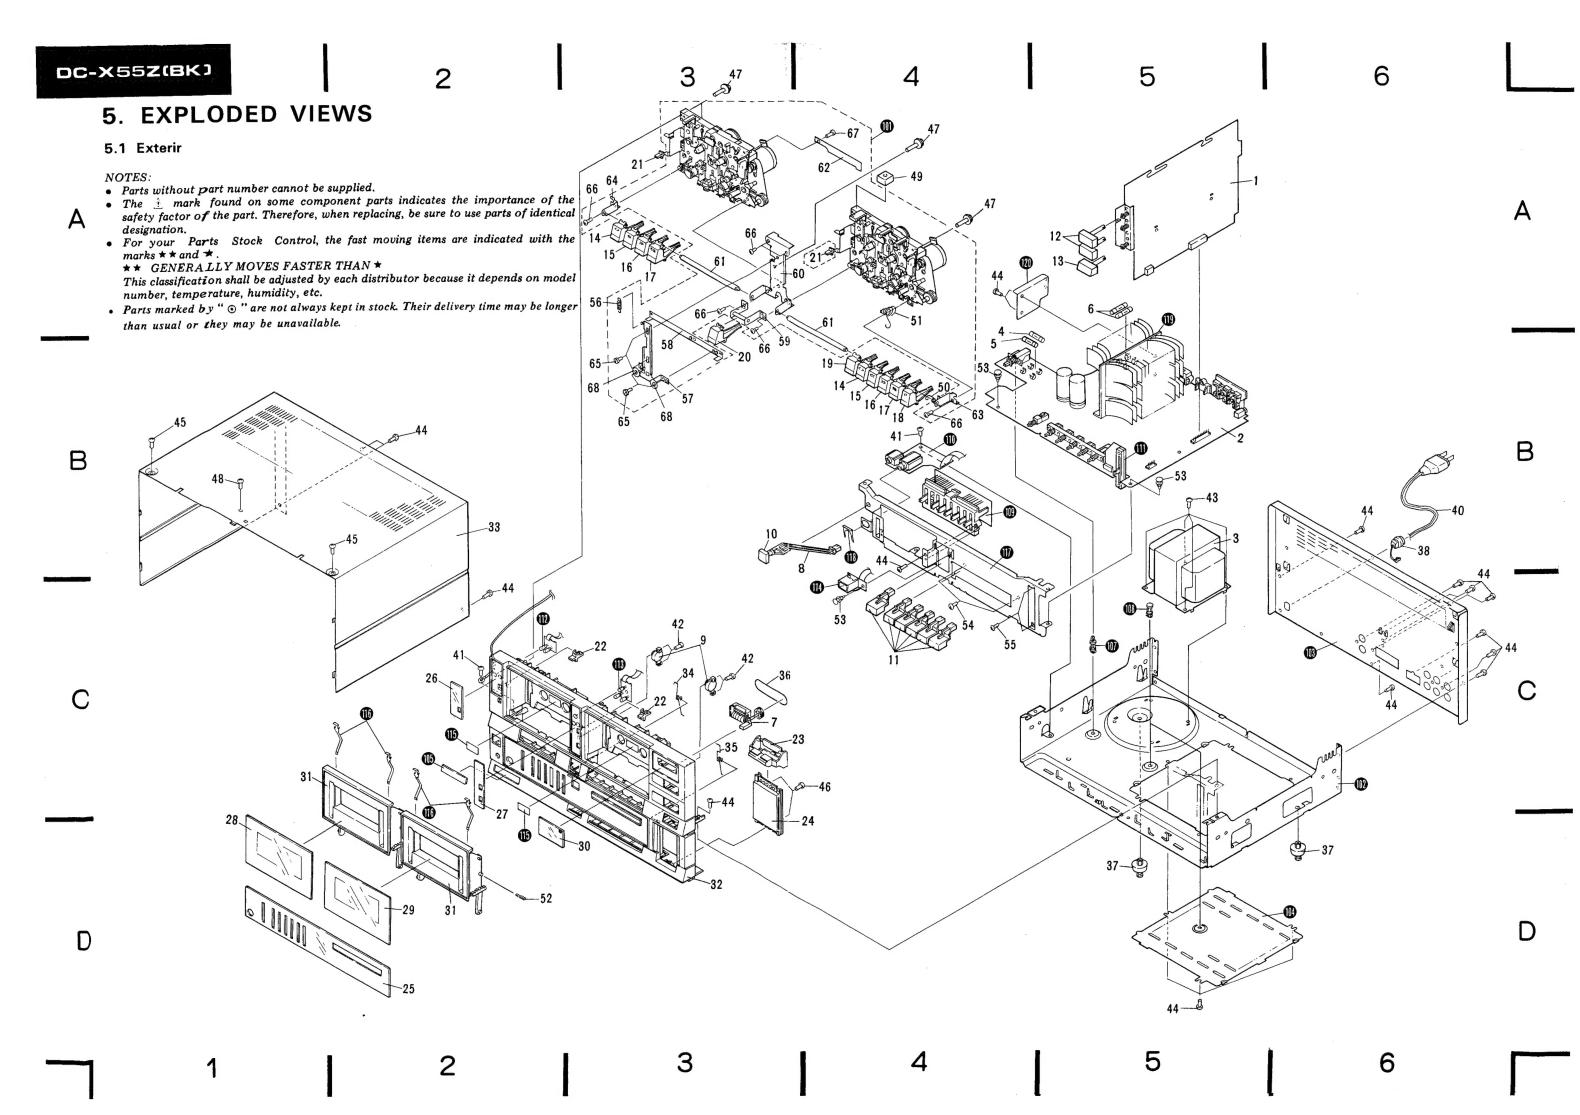

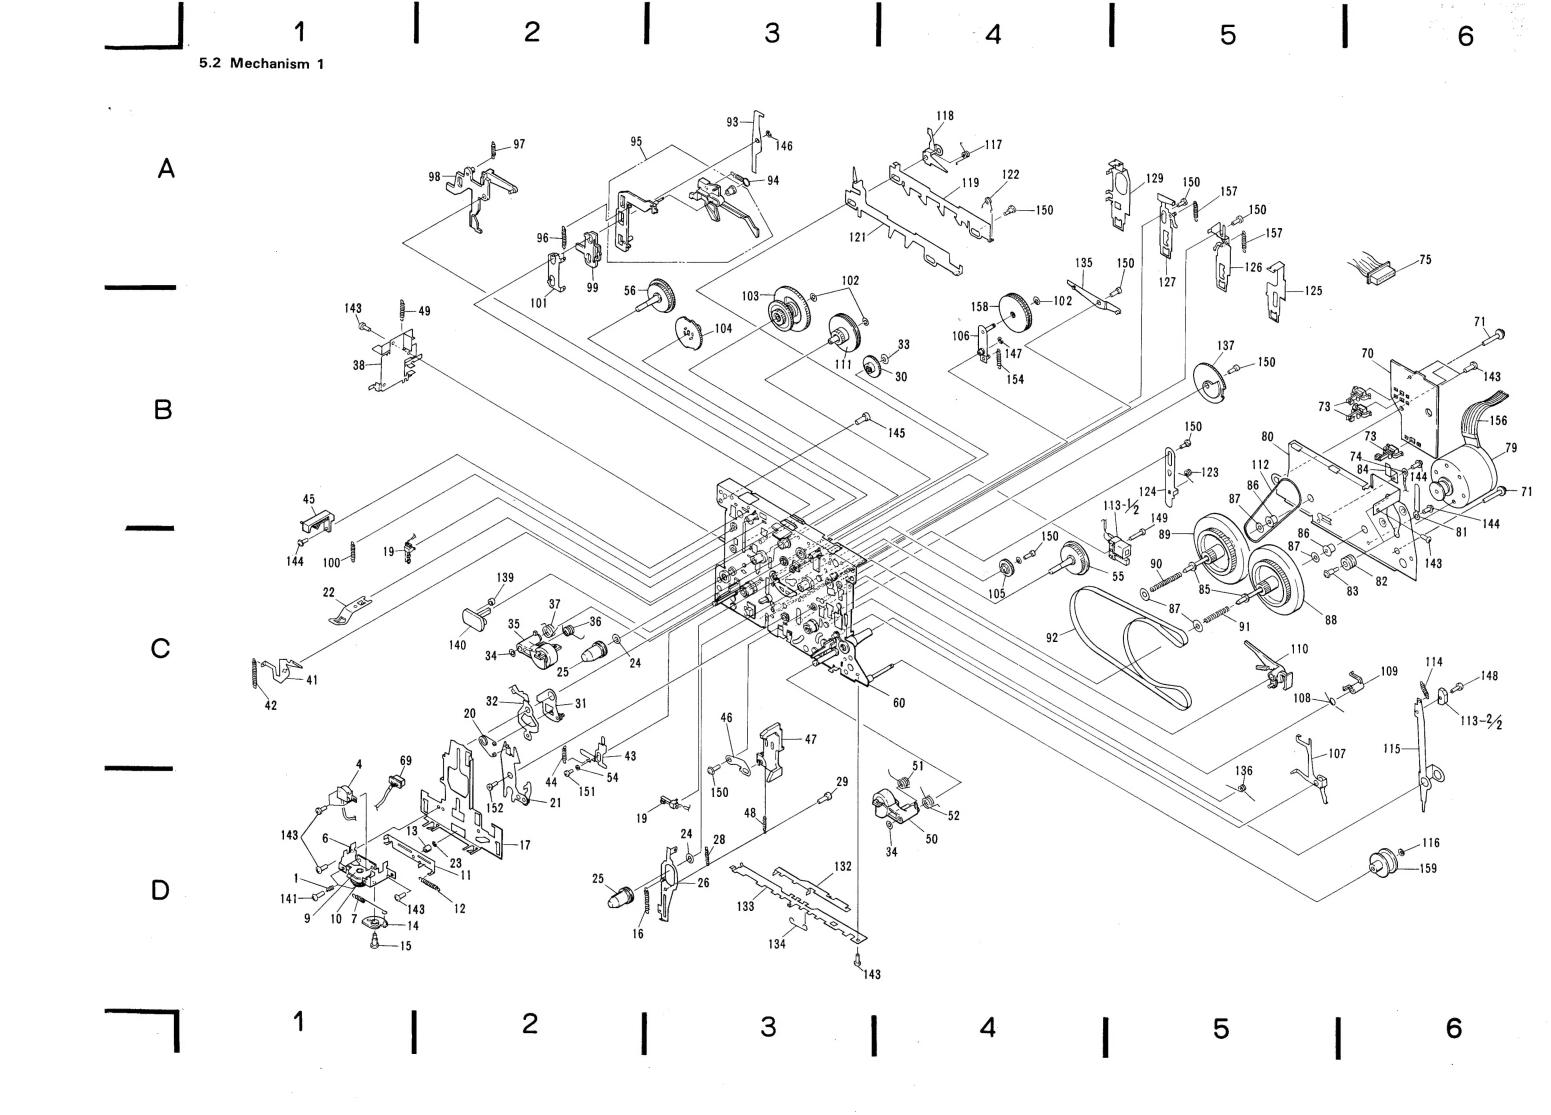

Top View with Bonnet Case Removed

Rear Panel View

NOTES:

- Parts without part number cannot be supplied.
- The A mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.
- For your Parts Stock Control, the fast moving items are indicated with the marks ★★ and ★.
 - ** GENERALLY MOVES FASTER THAN *

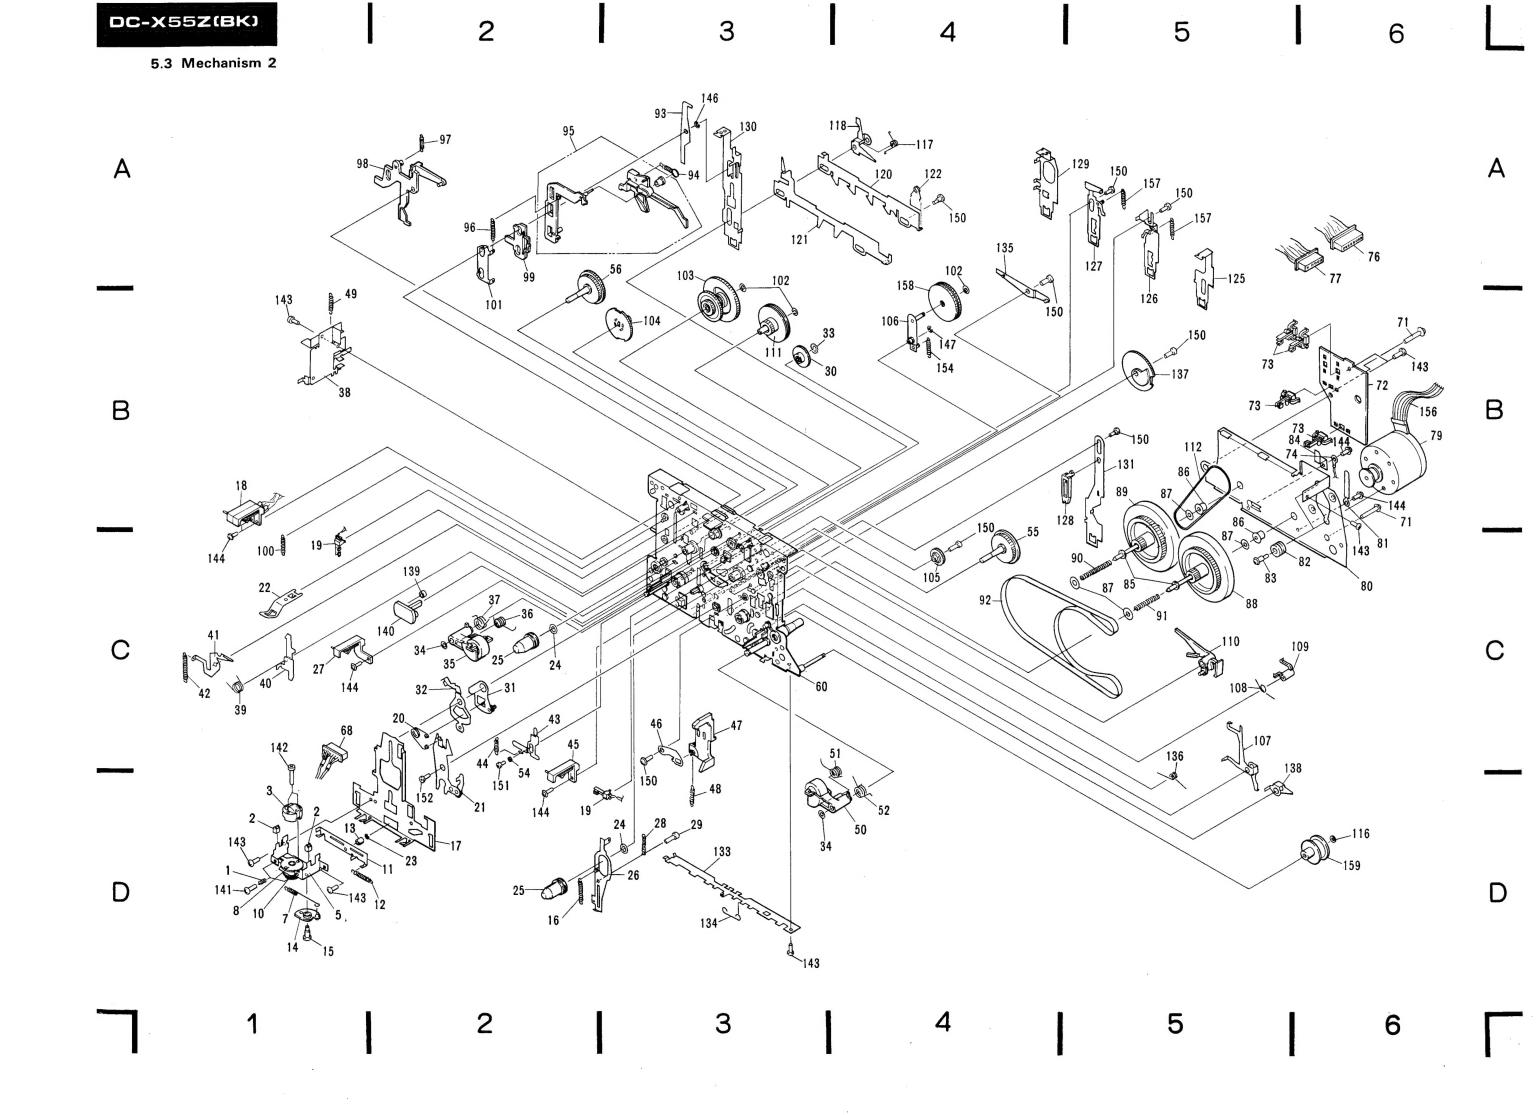

This classification shall be adjusted by each distributor because it depends on model number, temperature, humidity, etc.

• Parts marked by "⊙" are not always kept in stock. Their delivery time may be longer than usual or they may be unavailable.

7. ELECTRICAL PARTS LIST

- When ordering resistors, first convert resistance values into code form as shown in the following examples.
 - Ex. 1 When there are 2 effective digits (any digit apart from 0), such as 560 ohm and 47k ohm (tolerance is shown by J=5%, and K=10%). 561.... RD%PS 561 J 56 × 101 473.... RD%PS 473 J 47×10^3 $47k\Omega$ OR5 RN2H OR5 K 0.5Ω
- 010 RS1P @[]@ K Ex. 2 When there are 3 effective digits (such as in high precision metal film resistors).
 - $5.62k\Omega$ 562×10^{1} 5621 RN%SR 5620 F
- The A mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.
- For your Parts Stock Control, the fast moving items are indicated with the marks ** and *
- ** GENERALLY MOVES FASTER THAN * This classification shall be adjusted by each distributor because it depends on model number, temperature, humidity, etc.
- Parts marked by " @ " are not always kept in stock. Their delivery time may be longer than usual or they may be unavailable.

10. CIRCUIT DESCRIPTIONS

10-1. BASIC BLOCKS OF DC-X55Z AND DC-X33Z SIGNAL SYSTEMS

The difference of the two is mainly at the deck section. Table 10-1 indicates the comparative table. As the DC-X33Z is a lower model of DC-X55Z, description will be given mainly on the DC-X55Z.

The signal system basic block is herein indicated so as to comprehend the DC-X55Z signal system from 10-1-1 to 10-1-4.

Table. 10-1

		DC-X33Z	DC-X55Z	Remark
Mechanism structure		Single (Mechanism 2*1)	Double (Mechanism 1*2 and 2)	*1:Approximately similar to the mechanism 2 of DC-X55Z (REC/PB mechanism) *2:Playback only

10-2. BLOCK DIAGRAM

Fig. 10-2-1 indicates the block diagram of DC-X55Z. Take note that there is no mark in the Fig. of DC-X33Z.

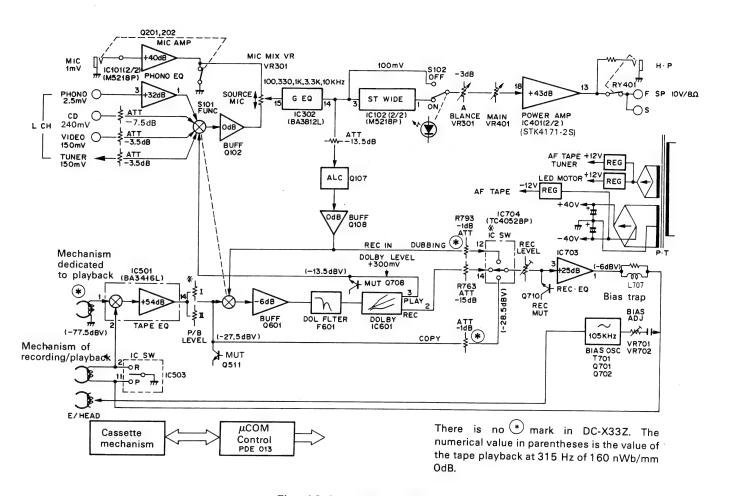

Fig. 10-2-1 Block diagram

The characteristic of this model is that it has only one system in the deck playback system and that this system uses the respective modes of operation separately so that the mechanism 1 does not overlap with the signal system of mechanism 2.

(Flickering stops at

10-3. LEVEL DIAGRAM

Fig. 10-3-1 shows the level diagram.

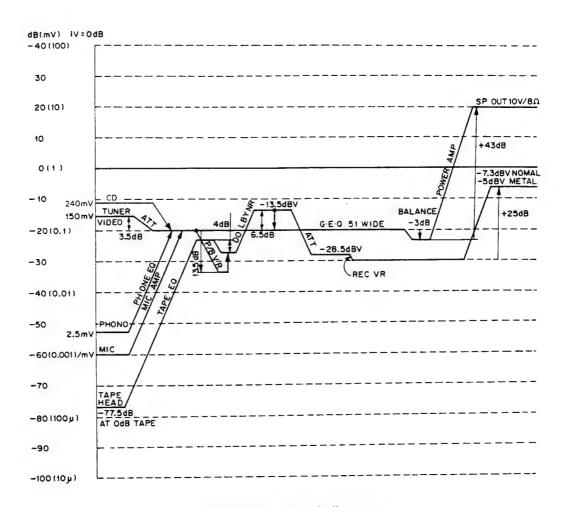

Fig. 10-3-1 Level diagram

10-4. SURROUND AND STEREO WIDE CIRCUIT

Fig. 10-4-1 shows the block diagram of the surround and stereo wide circuits.

This circuit leaves the normal component of the medium and low bands as is, and adds the inverse plase to the high and medium band components (There are many reverberal components and ambiance components). In this manner, the normal position of the bass, vocal, etc. become devoid of bad effects, and the sound is heard widening toward the left and right. Also, if a surround loudspeaker is used, one gets the feeling of being surrounded by the sound.

Regarding Fig. 10-4-1

- . The input signals of L and R go through a filter which suppresses the respective medium and high band components.
- Creates an L and R signal component difference and perform addition to the L-ch and subtraction to the R-ch.
- By performing such calculations, it emphasizes the differential signal components in the medium and high bands in the original source, and obtains a wide sound which is not unnatural (distorted feeling).

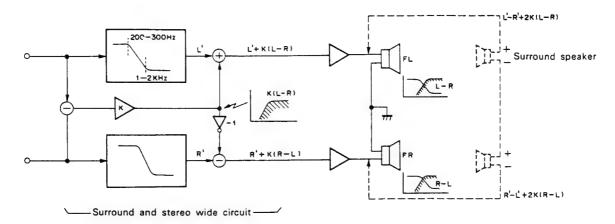

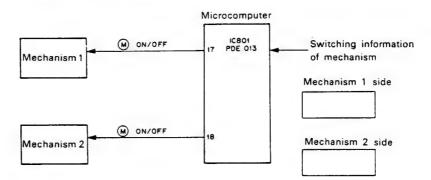

Fig. 10-4-1 Surround and stereo wide circuit block diagram

10-5. MICROCOMPUTER FOR CONTROL

The microcomputer IC801 (PDE013) of DC-X55Z gives the on-off commands of the motor only against the mechanism (mechanism 1 and mechanism 2). Also as input, it observes the switch information of the mechanism. The on-off operation of the motor is carried out with this switch information. See Fig. 10-5-1.

In addition, this microcomputer also controls the circuit block (See Fig. 10-5-2). In 2 10-5-3, there is a list of the typical timing chart, pin name and functions.

* SW information on the mechanism 1 side Main SW → Same as mechanism 2 Play SW → Same as mechanism 2 Mute SW → Same as mechanism 2 First SW → On where the knob of FF or REW is being pressed Direction SW → Same as mechanism 2 Chrome SW → Off when chrome or metal

* SW information on the mechanism 2 side (Except stop or pause)
Main SW→On when knob is turned on
Play SW→On when the play knob is pressed
Mute SW→On when the head and tape is in contact
REC SW→On when REC knob is pressed
Direction SW→On when in reverse playback
Anti-REC A SW→Off when claw on A side is broken
Anti-REC B SW→Off when claw on B side is broken
Mode SW→Off when display is →
Chrome SW→Off when chrome and metal
Metal SW→Off when metal

17	M1	Output	Motor control output of mechanism I ("O" during on)	
18	M2	Output	Motor control output of mechanism II ("O" during on)	
19	REC IND	Output	Recording IND output ("O" when lit)Note 4)	

Fig. 10-5-3(2/2) PDE013 pin name and function

* The output pins are all open collector outputs.

Note 1: Sync SW is not used. In this case, PULL DOWN sync input.

Note 2: Only when DIRF input is 1 (During A side running), it may cause flickering output.

Flickering condition: When it is stopped during recording of REV side.

Flickering condition: When all the knobs are pressed

except stop or pause, or when ejected.

Flickering ascertains that the running is in FWD, and does not have any connection with the ordinary

operations.

Note 3: Immediately after start of copying, it instantaneously operates as input. The trigger is REC mute output.

During high speed REC mute INT During normal High speed SW

Note 4: During REC→lights

During copying

During normal \rightarrow Repeats flickering at about 1.2 sec

interval

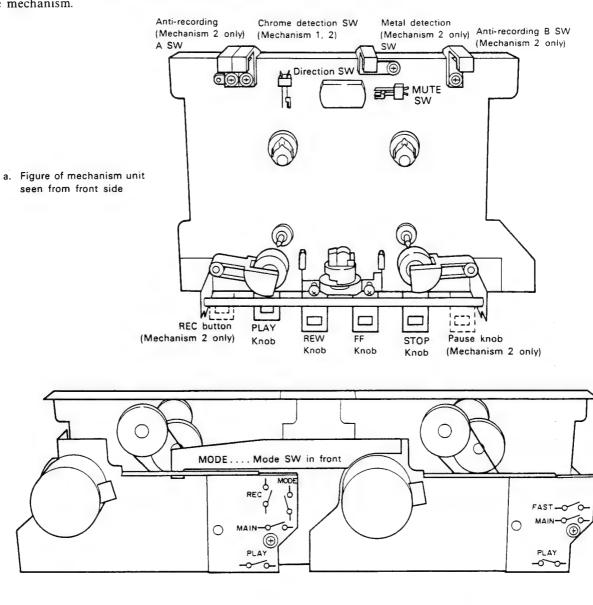

During high speed \rightarrow Repeats flickering at about

0.6 sec interval

10-6. RELATIONSHIP BETWEEN MECHANISM OPERATION AND CONTROL MICROCOMPUTER

Before going into the main subject, Fig. 10-6-1 indicates the position and its role of the various SW on the mechanism.

In addition, as the names of "Mode" SW and "Direction" SW are used frequently in this manual, it is recommended that due notice be taken in their relation to the front panel.

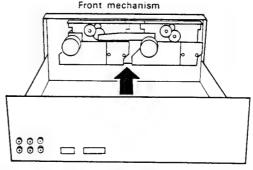

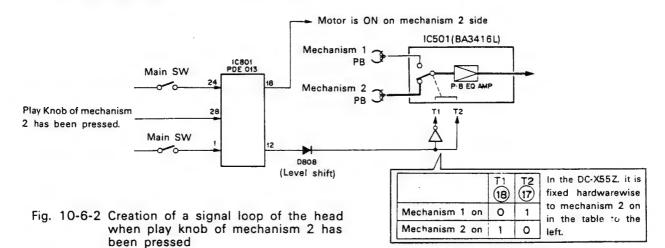

Fig. 10-6-1 Position and role of the various SW

10-6-1. When Mechanism 1 or Mechanism 2 Operates (Slay) Independently

The microcomputer coserves with the main switch, as indicated in Fig. 10-6-1(b), as to which knob of the mechanism has been pressed. Against the side of the mechanism of which this switch is on, the signal is output which turns the motor on.

Next, as explained in the block diagram 2, the DC-X55Z has only a single playback amp. Therefore it becomes necessary to make a loop in order to send to the playback amp. the playback signal obtained from the head on the selected mechanism side.

These functions are indicated in Fig. 10-6-2.

10-6-2. When Mechanism 2 Side Performs REC Operation

Pin (12) output (EQ output) of IC801 (PDE013) is switched to playback of mechanism 1 at "H".

Make pin (15) (mechanism 2 recording/palyback switching output) into "L" and induce REC mode. By doing so,

- IC503 is switched to REC mode.
- Make into operation possible state the SW of IC704. (Make to enable)
- Operates the bias oscillator
- · Lights the REC IND

The above-mentioned operate and mechanism 2 goes into REC operation.

Moreover, as to the judgment whether it enables the REC operation in practice is judged by the anti-REC SW [See Fig. 10-6-1(a)] alone. (This model is structured mechanically so that the REC knob may be pressed even when the tape erroneous erasure prevention claw is broken. In case the claw is broken, it is so structured that the motor does not rotate and recording may not be performed.)

When reading the anti-REC SW state, it is performed during the start of REC. (The microcomputer does not observe thereafter). These relationships are shown in Fig. 10-6-3.

In Fig. 10-6-3, when the erroneous erasure prevention claw is broken, pins (2) and (22) of the microcomputer become "H" due to the anti-REC SW being off, and therefore does not become into the REC state.

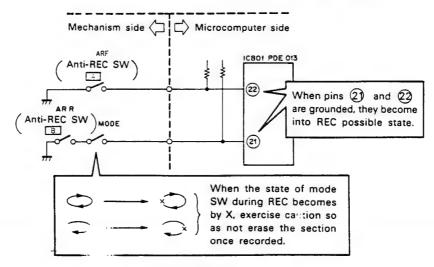

Fig. 10-6-3

10-6-3. Relay-play Operation

The DC-X55Z does not have this function.

In order to become into the relay-play operation, it is conditioned that both play switches are on of mechanisms 1 and 2.

It is also so structured that the first played mechanism is always played back on the A side. In addition, in accordance with the state of the tape playback mode SW on the front panel, the operation will become as shown in 2 10-6-4 (According to the example set forth in 2), both mechanisms of 1 and 2 are in the auto-reverse mode.)

In Fig. 10-6-4, the signal which serves as a trigger by detection of tape end and changing tape from B to A is due to the direction switch which is shown in 2 10-6-1. (Off when playing back A side and on when entering B side playback) In accordance with the information of this switch, pins 23 and 26 of the microcomputer change.

When mechanism 1 becomes from A side to B side and the B side becomes end, the microcomputer observes that it is in mechanism 2. At this point, if mechanism 2 awaits at play, make pin 17 from "L" to "H" and stop mechanism 1. Furthermore, make pin 18 from "H" to "L" and play mechanism 2.

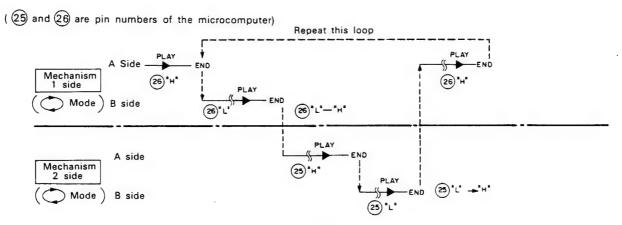

Fig. 10-6-4

10-6-4. Copy Operation

Not available for DC-X55Z.

By pressing the sync knob on the front, mechanism 1 becomes into play state and mechanism 2 into REC state. The microcomputer observes this state (When the play SW enters into about ± 1.2 sec against the REC SW) and judges that it has become into copy mode.

When it becomes into this mode, the microcomputer makes a series of operations as follows:

- Observes the state of the high speed SW.
 A pulse of approximately 20 μsec is output from pin (10). If this can be read at pins (7) it becomes into high speed recording mode.
- 2. Set to normal recording or high speed recording. High speed recording when pin (6) is "H". Normal speed recording when pin (16) is "L".
- Flickers REC IND.
 0.6 sec cycle during high speed recording
 1.2 sec cycle during normal speed recording
- 4. Makes mechanism 1 into play, and mechanism 2 into REC. Makes pin (9) to "H".

10-6-5. Others

Warning against misrecording

In the DC-X55Z when the recording is cut off on the midst of the B side, and then it is desired to continue the recording thereafter on the B side the following operation is performed.

- 1. Turn on PAUSE.
- Provide for recording state.
- 3. Provide for B side with direction switch.
- 4. Release PAUSE.

Caution should be exercised because when the recording state is engaged outright, recording will be performed on the A side. In order to prompt this caution, this unit flickers the ">" side of ">" (Pin 25 output of microcomputer)

11-2. OPERATION OUTLINE OF **MECHANICAL SECTION**

11-2-1. Operation Lever Arrangement

11-2-2. Play

It is put into play mode by the mechanical assist.

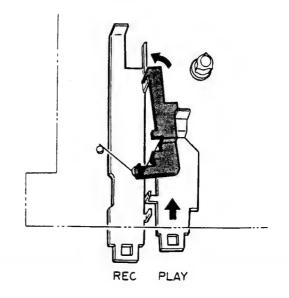

11-2-3. REC & Play

Play mechanism

1. In the play mode it becomes into <<(REW) or >>(FF). and REV or CUE operation. If it has been in the music selection mode (separate circuit) <<(REW) or >>(FF) is locked and it can be released by the solenoid switch being turned off.

REC mechanism

- When the operation lever of the REC is pressed, that of play is also linked to operate.
- When in the play mode, if the REC operation lever is pressed, it does not operate.
- When in >>(REW) or <<(FF) mode, if the REC operation lever is pressed, it does not operate.
- When in the play mode, if <<(REW) or >>(FF)operation lever is pressed, the play mode is released and it becomes into <<(REW) or >>(FF) single mode.

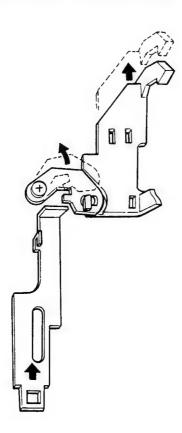

11-2-4. << & >> (REW & FF)

- It becomes into the REW & FF against the FWD mode and becomes the FF & REW mode against the REV mode.
- 2. Direct lever pressing << REW to >>(FF) or from >>(REW) to <<(FF) is not permissible. Be sure to press the lever once via the stop operation.

11-2-5. Stop/Eject

- 1. Releases the lock of other operation plates. (Except for PAUSE)
- 2. When the other operation plates are not locked, press the latch lever.
- 3. When the head board is in the suficiently advanced state, the STOP plate cannot be inserted even when the other operation plates are unlocked. (The above-mentioned situation is conceivable when the power switch becomes off during the play mode and thereafter the stop operation is performed and the carrying out of the eject operation is intended.)
- 4. The state of the PAUSE plate has no relations to the operation of the STOP/EJECT plate.

11-2-6. Pause

During the REC or play mode, it can be turned into the pause mode by pulling back the head board a little.

11-2-7. Direction

- When the operation is performed dring the REC or play modes, the tape running direction changes to FWD → REV or REV → FWD.
- This operation is prohibited when it is not in the REC or play mode.
 See the description of "DIRECTION".

11-2-8. Mode

- 1. In the mode of , the tape running direction is automatically changed at the tape end of the FWD or REV and this operation is repeated.
- 2. In the mode of \supset , the tape running direction becomes REV at the tape end of FWD and automatically released at the tape end of REV.
- During << or >>, the tape running directions are automatically released at the respective tape ends.
 See the description of "MODE SELECTION".

11-2-9. Head Rotation

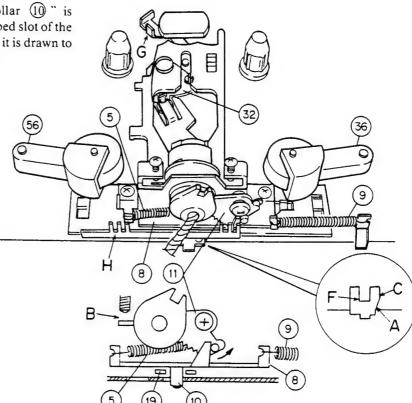

The deviation of the "slide plate 8" to the right or left corresponds to the head rotation and the selection of "pinch arm assembly R (3)" and "pinch arm assembly L (3)".

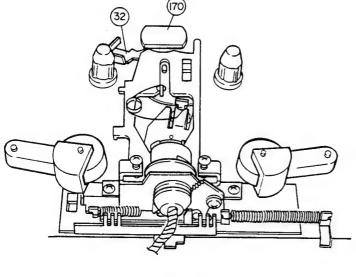

- 2. During the stop mode (the state in which none of the operations are being carried out), the head board is positioned at the furthermost back.
 - The "slide plate (8)" is drawn to the right direction by "spring (9)". This is specified as the FWD standby state.
 - The "collar 10" of the slide plate contacts with the A section of the U shaped slot of the board. Therefore, the head does not rotate completely and, accordingly, it provides a clearance in the azimuth adjusting section B. This is provided to prevent the shock caused when switching of the REV FWD mode.
- 3. When the head board is advanced the "collar 10" moves to the C section of the U shaped slot. Since this section is larger than the A section, the "slide plate 8" is further pulled to the right direction and the head rotation is regulated by the azimuth adjusting section B via the "head gear B 11". At this point, there is a clearance provided between the "collar 10" and the board C section.

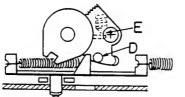

4. When the "reverse A 32" is rotated, the "collar 10" is shifted to the left via the "pinch pressure lever caulking assembly 19". The shifting amount is in degree to the making of a clearance between the "slide plate 8" and the projection D of the "head gear B 11". As a result, the head is rotated until it contacts with the azimuth adjusting section E by the pressure of the "head gear spring 5".

As the head board advances, the "collar ①" is supported by the F section of the U shaped slot of the board, and maintains the state in which it is drawn to the left, and becomes in REV mode.

5. In the stop mode, move the G section of the "reverse A (3)" in the direction of arrow by hand as shown in Fig., and the operation condition can be found. Moreover, the head board can be advanced to observe the condition with the H section. Finally, be sure to confirm that the head board has completely been recoded.

11-2-10. FWD Priority

- Once the stop operation is carried out the next REC or play operation is started from the FWD mode. When pause is required in the process of REV mode, perform pause operation.
- 2. The aforementioned head rotation operation is carried out by every half rotation of the "reverse cam
 - It becomes into the FWD mode after a short pin has passed through and the REV mode after a long pin has passed through.
- If the stop operation is carried out from the REV mode, the head board is receded and it becomes into the FWD standby mode as mentioned previously.
- 4. The "reverse A 32" is also returned at this point; however, the long pin of the "reverse cam (70)" is being pushed a little. Consequently, the "reverse cam (70)" turns a half rotation immediately or immediately after the motor is activated again to synchronize with the FWD mode related to the head board.

11-2-11. Play Assist

1. When the "play plate (56)" is inserted, it sets the "assist arm (65)" free and rotates the "assist gear (67)" a little by the force of the "trigger returning spring (66)".

The assist gear becomes engaged with the gear of the flywheel and it turns nearly one rotation and when it arrives at the notch of the gear, it is stopped by the top section of the assist arm.

A cam is formed on the other side of the assist gear and the "auxiliary plate ② " is pushed up alongside the cam face and pulls up the "head board ① " through the "spring ① ".

through the "spring 4".

2. The "idler gear 30" is attached to the "idler gear plate 31" and the selection of the FWD and REV modes are capable by the "inverse spring 18". The transmission of the take-up torque to the reel table becomes possible by advaning the head board.

3. When the "play plate (56)" is returned by the stop operation, etc., the "assist arm (63)" is also returned and the "assist gear (67)" becomes free and it is receded together with the "head board (15)" and the "auxiliary plate (26)" by the head returning spring (28)"

11-2-12. Reverse Auxiliary Plate

During the REV mode, the "idler 30" receives the pushing back force in relation to the rotation direction. When the head board advances, the edge of the "idler plate 31" is held to prevent it from being pushed back

11-2-13. Direction

1. Switching of the FWD and REV is carried out by every half rotation of the "reverse cam (70)". (Refer to item 9 and 10) The "reverse gear (29)" is connected to this across the board.

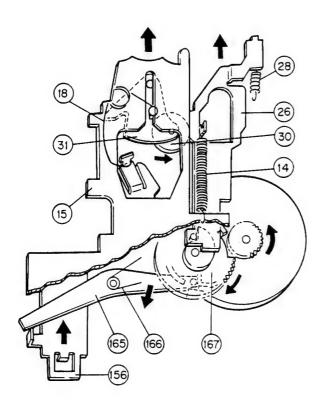

There are two V shaped concave section which face each other at 180° on the cam face closer to the inner circumference of the "reverse gear (29)". In addition, two V shaped convex sections face each other at 180° on the cam face closer to the outer circumference of the said gear. The outer circumference has 2 notch sections.

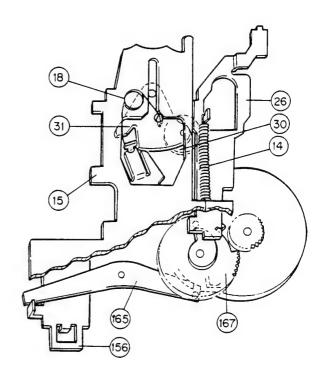

2. The tip pin section of the "DR lever (22)" is engaged with the concaved section of the reverse gear cam face by "spring (2)" to fix the gear position. At this position, due to gear notching section, it is not engaged with the "tension pulley (27)" which is always rotating at a low speed.

3. When the operating edge of the "DR lever (22)" is drawn toward you, the pin section comes out from the concaved section of the cam face and strikes against the sloped face of the concave and rotates this reverse gear a little.

 Accordingly, the gear enchagement is started and the reverse gear rotates only by half rotation.

5. The shift operation of the "DR lever (12)" is so designed as to prohibit the play plate from being inserted relative to the A section and the "play plate (59)"

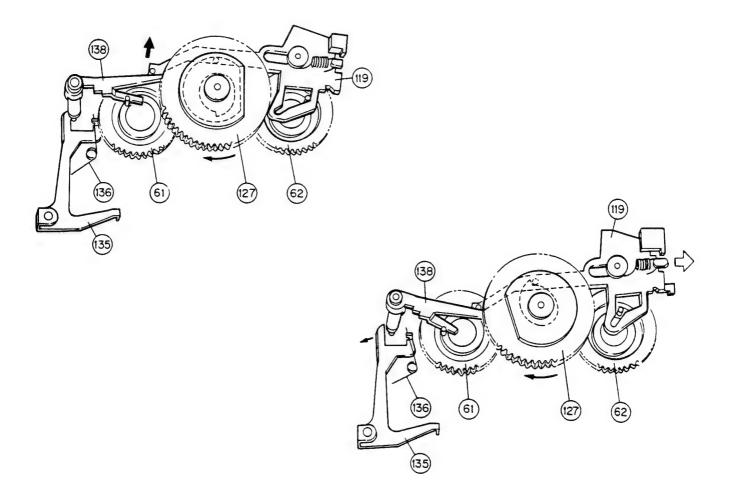

11-2-14. Automatic

- 1. On the lower part of the "reel tables 61 and 62", there is a pin which is connected to them by a small torque to rotate together.
- 2. The pin contacts against the short branch of the "detection prevention lever (138)", and while the FWD side reel table is rotating in the FWD direction. it receives the force in the direction of arrow.
- 3. A pin is inserted into the square shaped slot of the "detection lever (19)", and it is moved in the direction of arrow during the rotation to REV direction by this pin, and during the rotation to the FWD direction by the detection prevention lever.
- 4. To the "tension pulley (2)", which is always rotating at a low speed, a stepped cam is provided close to the center and a eccentric circumferential shape cam is provided close to the outside. The wall section A in the top section of the "detection lever (19)" is inserted to the concave section between those two cams.

- 5. During rotation of the reel table the A section, within the cam groove, always totteringly tends to go outward alongside the 1 circumferential cam surface.
- 6. When the reel table is suspended, as the force to go outward becomes dormant, the A section is drawn inward by the outer circumference cam surface. Thereafter it stays as is and collides with the staircase of the inner cam. By moving it in the direction of →, it performs automatic operation.
- 7. The eccentric force is applied to the "detection prevention lever (138)" so that the automatic operation does not activate while the "detection prevention plate (138)" and "spring (136)" are in stop or pause modes.

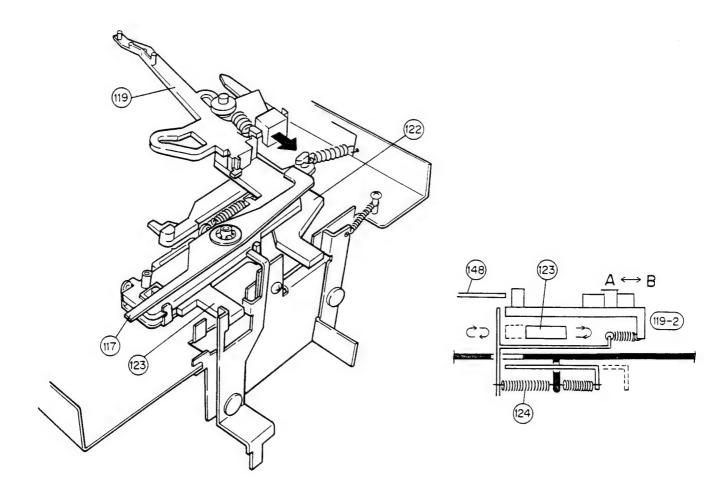

11-2-15. Mode Selection

- 1. The movement of the "detection lever (19)" in the arrow direction is transmitted selectively to the A section of the "DR lever (22)" or the B section of the "release lever (17)". When it is transmitted ot the DR leverl, it becomes the direction selection and to release lever, it becomes into automation release.
- 2. The "detection lever (19)" is installed at the section of (19-2). When (19-2) section slides to the A direction, it becomes the DIRECITON (continuous) and to the B direction, it becomes the automatic release (one round trip and then stops).
- 3. The "stopper plate B (48)" acts when in the << or >> operation and makes it into the end automatic release preferentially.
 - When setting the "mode lever (23)" to , the next one becomes the DIRECTION selection (continuous mode) with first priority.
 - When setting the "mode lever (23)" to , it becomes selection during the FWD mode and automatic release during the REV mode.
- 4. The "spring (24)" is a weak spring. It is required that the sliding is carried out lightly.

11-2-16. Others

It the play operation is carried out when the power switch is turned off, there may be cases in which the assist gear is still engaged. When the power switch is turned on, it becomes the following mode after once passing through the play mode.

12. ADJUSTMENTS

Tape speed adjustment

- 1. Connect the frequency countr to the TP1 terminal (Dolby TP: R-ch) on the complex assembly.
- 2. Turn the tape switch on.
- 3. Mount the test tape STD-301 onto deck I.
- 4. Short-circuit between terminals TP4 and TP5 on the tape assembly and put the deck I into play mode. (STD-301 is play backed in double speed.)
- 5. Adjust with VR803 so that the playback signal frequency of deck I becomes $6020Hz \pm 10Hz$.
- Release the short-circuit between terminals TP4 and TP5.
- Put the deck I into play mode and adjust with VR804 so that the playback signal frequency becomes 3010Hz ±5Hz.
 - (Note 1: Be sure not to turn VR803 while performing the normal speed adjustment.)

- 8. At this point, be sure to confirm that the wow and flutter are within 0.3% both in the double and normal speeds.
- 9. Mount the test tape STD-301 onto deck II.
- Short-circuit between terminals TP4 and TP5 on the tape assembly and put the deck II into play mode. (STD-301 is play backed in double speed.)
- 11. Adjust with VR802 so that the playback signal frequency of deck II becomes ±20Hz against that of deck I.
- 12. Release the short-circuit between terminals TP4 and TP5.
- 13. Put the deck II into play mode and adjust with VR801 so that the playback signal frequency of deck II becomes ±10Hz against that of deck I. (Note: Be sure not to turn VR802 while performing the normal speed adjustment.)
- 14. At this point, be sure to confirm that the wow and flutter are within 0.3% both in the double and normal speeds.

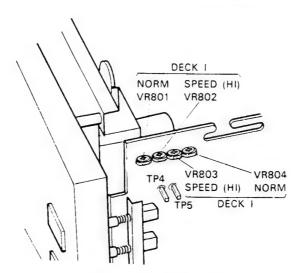

Fig. 12-1 Adjustment Point

Electrical system adjustment

Prior to the electrical system adjustment, be sure to confirm the following itesm.

- 1. The mechanical adjustment should be completed.
- 2. Perform cleaning of the head and the demagnetization of head with the head eraser.
- The level during measurement is determined at 0dBv = 1V.
- 4. The specified tape should be used for adjustment. Since the test tape has A side and B side, use the A side with label.

STD-331B: For playback system adjustment

STD-608A: Normal blank tape STD-620: CrO₂ blank tape STD-610: Metal blank tape

- Prepare the following measuring instruments.
 AC millivoltmeter, low frequency oscillatore, attenuator, and oscilloscope.
- 6. For the adjustment, perform both L and R channels unless otherwise specified.
- 7. Turn the Dolby NR switch to off unless otherwise specified.

- 8. Prior to the adjustment, be sure to perform aging of the set for several minutes. Especially prior to entering the adjustment of the recording and playback frequency characteristics, aging should be performed in REC/PLAY mode for 3 to 5 minutes.
- 9. The adjustment should be performed in accordance with the adjustment order. If the order is not kept, it may cause the failure of the complete adjustment which induces the inferior function of the unit.

Deck I

- 1. Head azimuth adjustment
- 2. Playback level adjustment

Deck II

- 1. Head azimuth adjustment
- 2. Playback level adjustment
- 3. Adjustment of recording and playback frequency characteristics
- 4. Adjustment of recording level

13. DISASSEMBLY

13-1. REMOVAL OF CASSETTE MECHANICAL UNIT

- 1. Remove 6 screws 1.
- 2. Remove the bonnet case.
- 3. Remove 2 screws 2.
- 4. Press the claw of the chassis bottom and remove the front panel (to which the cassette mechanical unit is attached) and pull out toward you.

5. Remove 4 tape assembly connectors (J9, J10, J11 and J12) and 2 parallel jumpers (J901 and J902) from the wiring connectors which are extended from the Bonnet case cassette mechanical unit. Tape assembly Front panel assembly

Fig. 13-1 Removal of the front panel assembly

- 6. Since J8 has been soldered from the rear side, remove the shield wire (the head shield wire of the mechanism I) by using a soldering iron and cut the binders B11 and B12 with a nipper, and then remove the front panel (to which the cassette mechanical unit is attached) from the main body.
- 7. Remove the counter belt from the counter and apply it to the cassette mechanical unit
- 8. Remove 6 screws 3 and remove the cassette mechanical unit from the front panel.

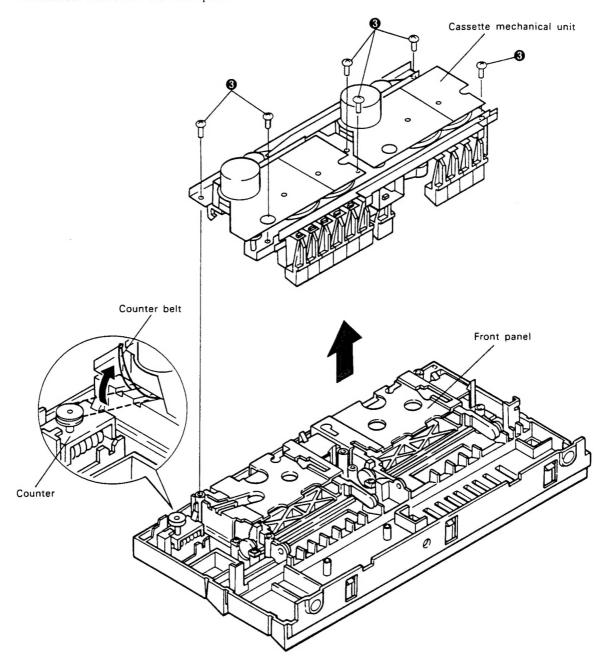

Fig. 13-2 Appliance of belt

13-2. REMOVAL OF BELT

- Remove the cassette mechanical unit from the main body.
 - (See Removal of mechanical unit)
- 2. Cut the binder which bundles the head lead wires.
- 3. Remove 4 screws **1** and remove the FW receiving plate from the mechanical chassis.
- 4. Remove the belt.

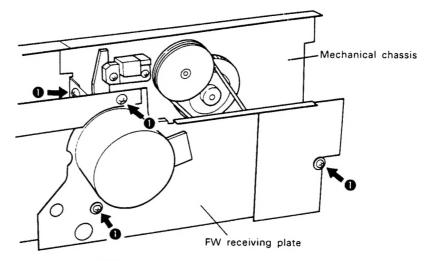

Fig. 13-3 Removal of belt

13-3. APPLIANCE OF BELT

- 1. Apply the flat belt as shown in the broken lines through (A) section (belt temporary holding shaft) in the Fig 13-4.
- 2. Apply the square belt as shown (in Fig.13-4.
- 3. Install the FW receiving plate to the mechanical chassis and transfer the flat belt, which has been held temporary at (3) section, to the motor pulley.

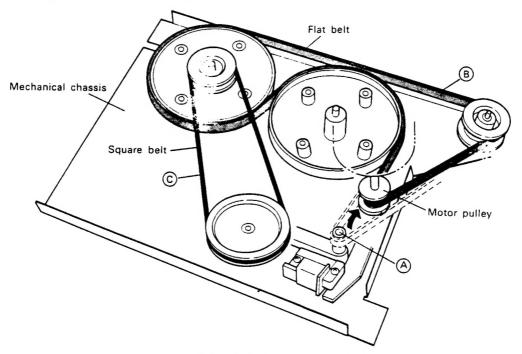

Fig. 13-4 Appliance of belt

13-4. REMOVAL OF MOTOR

- 1. Remove the mechanical unit from the main body. (See Removal of mechanical unit)
- 2. Remove the lead wires of the motor from motor. (See Fig.13-5)
- 3. Remove the FW receiving plate. (See Removal of
- 4. Remove 2 screws 1 and remove the motor. (See Fig.13-6)
- Note 1: Care should be taken to the motor installation direction and attaching position of the motor lead wires when the motor is replaced.
- Note 2: Perform the tape speed adjustment (See Fig. 13-6) when the motor is replaced.

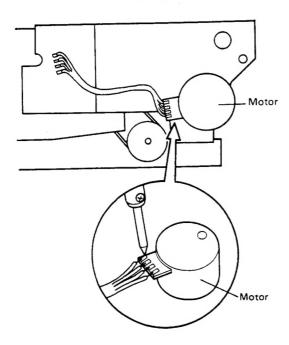

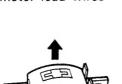

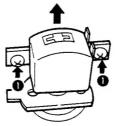

Fig. 13-5 Removal of motor lead wires

Black

Playback head

13-5. REPLACEMENT OF HEAD

- 1. Remove the mechanical unit from the main body. (See Removal of mechanical unit)
- 2. Remove 2 screws 1 for head installation and pull out the head assembly. (See Fig 13-7)
- Remove the lead wires from the head section board by using a soldering iron.
- Solder the new lead wires to the new head (See Fig 13-7)
- Note 1: At this point, be sure to make the soldering of the lead wires to their respective positions without
- Note 2: Be sure to perform the mechanical adjustment and electrical adjustment when the head is replaced.
- Note 3: When replacing the head, be sure lock the screws which have been used for the head installation.
